# Agenda

- Insertion sort definition
- Working and Algorithm
- Practice problem
- Pseudo Code
- Time complexity
- Advantages
- Disadvantages

# What is Insertion sort?

- Simple sorting algorithm
- It sorts an arbitrary array, one element at a time by incrementing the index of an array and compare the element with the previous elements(to the left) to find the suitable spot.
- Used in computer programs such as file search, data compression, and path finding.

# Working of Insertion sort

First Iteration:

Second Iteration:

Third Iteration:

key

8	9	<b>10</b>	<b>5</b>	6
---	---	-----------	----------	---

8	9	<b>5</b>	<b>10</b>	6
---	---	----------	-----------	---

8	<b>5</b>	<b>9</b>	10	6
---	----------	----------	----	---

<b>5</b>	<b>8</b>	9	10	6
----------	----------	---	----	---

Fourth Iteration:

key

5	8	9	<b>10</b>	<b>6</b>
---	---	---	-----------	----------

5	8	9	<b>6</b>	<b>10</b>
---	---	---	----------	-----------

5	8	<b>6</b>	<b>9</b>	10
---	---	----------	----------	----

5	<b>6</b>	<b>8</b>	9	10
---	----------	----------	---	----

# Practice problem

Array: 6,2,9,3,1,5,8,7,4

# Solution

Array: 6,2,9,3,1,5,8,7,4

Final Sorted array: 1,2,3,4,5,6,7,8,9

# Pseudo Code

```
void insertionSort(int arr[], int n)
```

```
{
```

```
    int i, key, j;
```

```
    for (i = 1; i < n; i++)
```

```
    {
```

```
        key = arr[i];
```

```
        j = i - 1;
```

```
        while (j >= 0 && arr[j] > key)
```

```
        {
```

```
            arr[j + 1] = arr[j];
```

```
            j = j - 1;
```

```
        }
```

```
        arr[j + 1] = key;
```

```
        // swapping
```

```
    }
```

```
}
```

```
//comparing the elements
```

# Time Complexity - Best Case Analysis

- The array is already sorted

1	2	3	4	5
---	---	---	---	---

- $A[i] \leq \text{key}$  is true for all the comparisons. (where  $i=j-1$ )

$$T(n) = c_1n + c_2(n-1) + c_4(n-1) + c_5(n-1) + c_8(n-1)$$

$$= (c_1 + c_2 + c_4 + c_5 + c_8)n + (c_2 + c_4 + c_5 + c_8)$$

$$T(n) = cn + c' = O(n)$$

# Time Complexity - Worst Case Analysis

5	4	3	2	1
---	---	---	---	---

- Array is in reverse sorted order
  - $A[i] > \text{key}$  in **while** loop is always true till the end of array
  - Compare **key** with all elements to the left
- We have a nested loop each of size  $n$  in the worst-case, so the time complexity will be of polynomial degree 2

$$T(n) = O(n^2)$$

# Time complexity summary

- For Best case scenario -  $O(n)$
- For Worst Case or the Average Case Scenario –  $O(n^2)$

THANK YOU!
